US-08-572-951-3; Sequence 3, Application US/08572951; Sequence No. 5824790; Patent No. 5824790; GENERAL INPORMATION:

```
APPLICANT: Springer, Franziska
APPLICANT: Abel, Gernot
TITLE OF INVENTION: DNA MOLECULES THAT CODE FOR ENZYMES
TITLE OF INVENTION: INVOLVED IN STARCH SYNTHESIS VECTORS BACTERIA TRANSGENIC
TITLE OF INVENTION: PLANT CELLS AND PLANTS CONTAINING SAID MOLECULES
NUMBER OF SEQUENCES: 17

New enzyme with starch synthase activity, useful for producing starch for foods and packaging materials -WPI; 2000-024508/03. N-PSDB; AAZ24487.

```
This invention describes a novel protein (I) with the activity of wheat starch synthase. Transgenic plants, specifically wheat, that contain (I) are used for production of starch, used particularly in foods.

Controllarly baked and pastry goods and for making packaging materials or disposable items. Starch may also be used as starting materials for glucose or glucos components (e.g. for fermentation or further chemical conversion); in paper and pulp production, as adhesives, in textiles, in preparation of gypsum-based building materials, as soil stabilizer, as wetting agent etc. in fertilizer and plant-protection compositions, as binder (in pharmaceuticals, cosmetics, coal briquetting and casting sand), as flocculant in soil or coal slurries, as rubber and leather compositions, as binder (in pharmaceuticals, cosmetics, coal briquetting and casting sand), as flocculant in soil or coal slurries, as rubber and leather collines. Transgenic plants with increased/decreased production of (I) produce starches with altered physical and/or chemical properties such as mylose/amylopectin ratios, degree of branching, mean chain length, phosphate content, gelatinization properties, gel- or film-forming properties, or starch grain size or structure. This sequence represents the soluble starch synthase isolated from wheat (Triticum aestivum L. cv. plantals).
                                                                                                    Page 19-21; 24pp;

Sequence

```
This amino acid sequence comprises a near full-length sequence for a soluble starch synthase of summer wheat (cv. Florida). It was deduced from a cDNA clone (AAV01527) isolated from a 1-day carryopsis cDNA library. A granule-bound starch synthase (see AAW29398) has also been identified. Isolated nucleic acids encoding these carymes can be inserted into vectors for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or of antisense sequences, allows starch metabolism to be regulated in transgenic plants.

Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the need for subsequent chemical phyphsical modification. Plants with altered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio, degree of branching, phosphate content, gelatinisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful carticularly in foods (especially bakery goods or pasta) or to produce packaging materials or disposable goods, as well as in any

The invention relates to a novel enzyme of starch biosynthetic pathway in a ceraal plant, where the enzyme is selected from starch branching enzyme (BBE) I, starch soluble synthase (SSS) I, and debranching enzyme (BBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of rice or maize. The methods and products can be used for targeting expression specifically to the endosperm of the seeds of ceraal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial isoamylase, oan be used for modifying the characteristics of starch produced by a plant. The present sequence represents the wheat SSS I protein sequence.

 The present sequence is maize starch synthase type I, useful in the production of starch. Starch can be used in various conventional starch applications, e.g. starch hydrolysate products, foods, papermaking, adhesives, textiles, building materials, soil stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal briquettes, ore and coal slurries, foundry casting, rubber, leather and synthetic polymers. The enzyme produces a starch stated to have different physicochemical properties, especially viscosity and selling properties, from wild type starch.

 The soluble rice starch synthetic enzyme gene has, at the N-terminal, the transit peptide that is required for the transition of this enzyme to the amyloplast. Introduction of this gene into the rice protoplast augments the expression of soluble rice starch synthetic enzyme. The transit peptide coding sequence can be used for the efficient transition of any protein into amyloplasts.

 The sequence is that of soluble starch synthase I. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.

 The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen-synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene, involved in production of amylopectin or amylose in its original host. The method is used to produce plant-like starches by fermentation and new starches in plants. These starches are useful for all food and non-food applications of starch. The present sequence is used in the course of the invention.
 Non-glycogen-like polysaccharide production; fermentation; starch synthesis enzyme; glycogen-synthesis enzyme; glycogen synthesis; non-starch branching gene; amylopectin; amylose; plant-like starch; maize starch soluble synthase I-2.

This amino acid sequence comprises a full-length sequence for a granule-bound starch synthase of summer wheat (cv. Florida). It was deduced from a cDNA clone (AAV01528) isolated from a 21-day caryopsis cDNA library. A solubled starch synthase (see AAW2397) has also been identified. Isolated nucleic acids encoding these enzymes can be inserted into vectors for production of transgenic plants, particularly starch-producing plants, specifically wheat.

Use of the isolated nucleic acids, or of antisense sequences, allows starch metabolism to be regulated in transgenic plants.

Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the need for subsequent chemical/physical modification. Plants with altered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio, degree of branching, phosphate content, gelatinisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods (especially bakery goods and pasta) or to produce packaging materials or disposable goods, as well as in any content known use of starch.
 7 GAGCLA----PSVRLRADPATAA------47
 Heic acid encoding starch synthase enzymes from wheat - for insgenic plants that produce modified forms of starch, useful enfoods, or for production of packaging materials and disposable

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
